

FLEXIBLE BUSINESS APPLICATIONS

# SQL Save

*for Microsoft Dynamics SL*

**More Convenient Database Backups**

Designed for

Microsoft  
Dynamics™ SL

by

# SQL Save

**Empower your users to backup Dynamics SL Databases without compromising security**

Now users can easily backup Dynamics SL databases without having to use SQL Enterprise Manager. They can easily backup their application and system databases on the fly before critical processing points that may require restoration. All of this functionality without having to compromise security by loading SQL Tools or Enterprise Manager on the local workstations, and granting unwarranted database access privileges. The system also features the ability to control the

naming of the database files as well as the directories to which the backup file will be generated. It also supports the organization of different databases into separate groups for backup purposes. You can backup an individual application database, all databases, or a group of application databases. You can also require users to key a user name and password before backups occur, or store the SA information in an encrypted format for automatic use for backups.

## Take a look inside...

### MAIN FEATURES:

- Back up multiple databases at once.
- Create custom Database lists to back up groups of databases.
- Save database backups on the fly in locations with one easy step.
- Multiple file naming features so you can easily keep track of your backups.
- Users do not need DBO or SA privileges.
- Secure Password Encryption.
- Backup History is tracked for reporting.
